

POWER MAP

Inside one apartment building, while a shared facility is out

student accommodation · social housing · private rental

WHAT THE MAP SHOWS

A mismatch between impact and power. The residents most affected depend entirely on operators, providers and managers to report, prioritise and explain the repair.

Read the two left quadrants together and a chain appears: staff who see the fault first have no say in when it is fixed, and residents who are unaffected never report it at all.

The queue is fed by the people least affected and endured by the people most affected.

JUSTIFICATION

Power means influence over the repair process: to order it, fund it, sequence it, or escalate it. Reporting a fault is not the same as influencing it. Every resident here can do the first; none can do the second.

Interest means how strongly a stakeholder is affected by, or concerned with, the outcome — not personal cost alone. Operators sit high on interest without experiencing the outage.

The three tenant groups cluster despite three different landlords — an operator, an agency and a private owner. That is why I sample across them rather than within one.

High-floor residents are included as a control: they show that severe inconvenience and loss of access are not the same thing.

Design opportunity

A clearer way for residents to report a failure, ask questions, and see how the repair is being handled.
