

STAKEHOLDER MAP

Inside one apartment building, while a shared facility is out

student accommodation · social housing · private rental

LEGEND

- T** tenant — my three participants
- R** other residents (comparison groups)
- S** building staff — see it, cannot decide it
- D** decides, funds or sequences the repair

WHAT THE MAP SHOWS

Everyone in the inner two rings can report a fault. What differs is what happens next: whether they are told anything, and whether they can act if they are not.

The people who see the fault first — caretaker, cleaners, security, reception — sit in the outer ring, furthest from the decision.

Proximity to the failure and influence over its repair run in opposite directions.

WHY THESE GROUPINGS

Partners.

The parties any redesign must go through. They decide, fund and sequence, so they are collaborators rather than targets.

Primary.

People whose access to their own home is directly affected. I include ground- and low-floor residents deliberately: they live with the same fault and never report it, which distorts what the repair queue receives.

Secondary.

Staff and contractors who influence the repair process but are not the people waiting for the facility.

Where the building is strata-titled, an owners corporation also holds a repair duty (s 106, SSMA 2015); I have mapped the roles inside the building.
